GROUP PROJECT NAME	: **A CRM APPLICATION FOR THE CHAISHOP&CO**

A CRM APPLICATION FOR THE CHAISHOP&CO

User Story

TheChaiShop&Co needs a centralized Customer Relationship Management (CRM) system to manage customer information, products, orders, sales activities, and customer interactions efficiently. The existing manual process of maintaining customer and sales information can lead to data duplication, difficulty in tracking customer details, and delays in managing orders.

As a **Salesforce CRM user**, I want to maintain customer details, manage products and orders, track sales activities, and monitor customer interactions in a single system so that TheChaiShop&Co can improve customer service, organize sales operations, and make better business decisions.

User Requirements

- As an **Administrator**, I want to manage users, customer records, products, and system information so that the CRM remains organized and secure.
- As a **Sales Representative**, I want to create and update customer records so that customer information is always available and up to date.
- As a **Sales Representative**, I want to manage customer orders and sales information so that I can track the sales process efficiently.
- As a **Sales Representative**, I want to record customer interactions and follow-up activities so that I can maintain good customer relationships.
- As a **Manager**, I want to view reports and dashboards so that I can monitor sales performance and customer-related activities.
- As a **CRM User**, I want to search and access customer information quickly so that I can respond to customer requirements efficiently.

Expected Outcome

The CRM application will provide TheChaiShop&Co with a centralized platform for managing customer relationships, sales activities, products, and orders. This will reduce manual work, improve data accuracy, and help users manage business operations more effectively.

Introduction

Customer Relationship Management (CRM) plays an important role in managing customer information and improving business relationships. For a growing business such as **TheChaiShop&Co**, maintaining customer details, sales information, products, orders, and customer interactions in an organized manner is essential for efficient business operations.

The **"A CRM Application for TheChaiShop&Co"** project is developed using **Salesforce**, a cloud-based CRM platform. The application provides a centralized system for storing and managing customer-related information and sales activities.

The main purpose of this project is to simplify customer management and sales processes by replacing manual methods with a structured CRM application. The system enables users to manage customer records, products, orders, sales activities, and follow-ups from a single platform.

Salesforce provides features such as objects, fields, relationships, validation rules, automation, reports, dashboards, and user access control. These features are used in the project to create a customized CRM solution according to the business requirements of TheChaiShop&Co.

The application helps employees access accurate information quickly, maintain customer relationships, track business activities, and generate useful reports for management. Overall, the project demonstrates how

Salesforce can be customized to create an effective CRM solution for a tea shop business.

Project Overview

The **“A CRM Application for TheChaiShop&Co”** is a Salesforce-based CRM application designed to manage and organize the company's customer and sales-related activities in a centralized platform.

The application is designed to provide an easy and efficient way to manage customer information, products, orders, sales activities, and customer interactions. Salesforce objects and customized fields are used to store the required business information, while relationships between records help users access related information easily.

Main Objectives

The major objectives of the project are:

1. To develop a centralized CRM application for TheChaiShop&Co.
2. To maintain customer information in an organized manner.
3. To manage products and their related information.
4. To manage and track customer orders.
5. To record customer interactions and follow-up activities.
6. To reduce manual data management and duplication.
7. To improve the efficiency of sales and customer service operations.
8. To provide reports and dashboards for monitoring business performance.
9. To improve data accessibility and accuracy.
10. To provide secure access to CRM information based on user requirements.

Key Modules

The application can include the following major modules:

- **Customer Management** – Stores and manages customer details and contact information.

- **Product Management** – Maintains information about tea products and other items offered by TheChaiShop&Co.

- **Order Management** – Records customer orders and tracks order-related information.

- **Sales Management** – Helps users monitor sales activities and customer requirements.

- **Activity Management** – Allows users to manage tasks, calls, meetings, and follow-ups.

- **Reports and Dashboards** – Provides summarized business information for analysis and decision-making.
- **User Management** – Controls user access and permissions within the Salesforce application.

Salesforce Features Used

The project can utilize Salesforce features such as:

- Custom Objects and Fields
- Standard Objects
- Object Relationships
- Validation Rules
- Formula Fields
- Record-Triggered Automation
- Flows
- Reports
- Dashboards
- Profiles and Permission Sets
- List Views
- Page Layouts

Overall Workflow

The basic workflow of the application is:

Customer Registration → Customer Information Management → Product Selection → Order Creation → Sales/Order Tracking → Customer Follow-up → Reports & Dashboards

Through this workflow, TheChaiShop&Co can maintain customer and sales information in one centralized Salesforce environment. The application improves data organization, reduces repetitive manual work, and provides users with quick access to important business information.

REQUIREMENT ANALYSIS PHASE

Customer Journey Map

Journey Stages:

- Login
- Access CRM Application
- Enter Customer Data
- Generate Orders
- Calculate Bills
- View Reports
- Decision Making

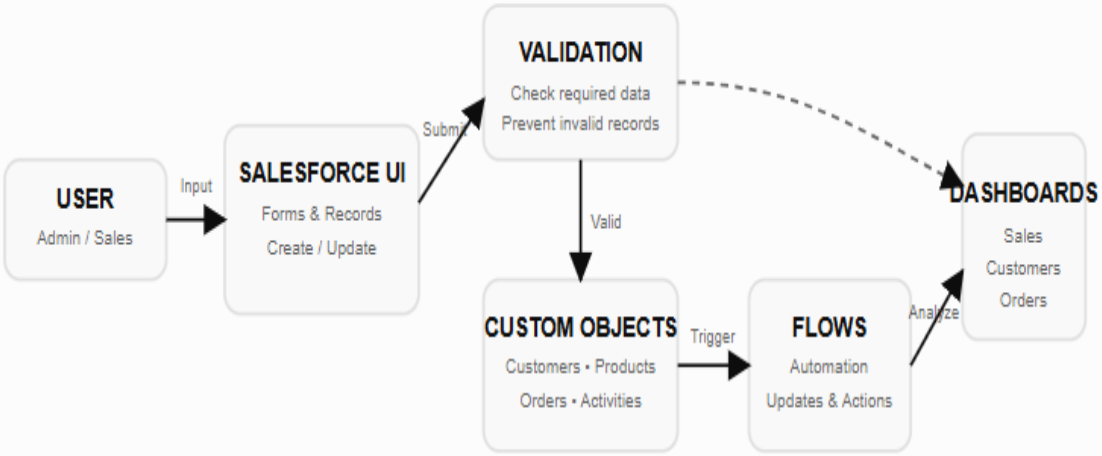

DATA Flow

User → Salesforce UI → Validation → Custom Objects → Flows → Dashboards

You can describe the flow in your documentation as:

1. **User** – Admin or sales users enter customer, product, order, and activity information.
2. **Salesforce UI** – Provides the interface for creating, viewing, and updating records.
3. **Validation** – Checks whether the entered data satisfies the required business rules.
4. **Custom Objects** – Stores the validated CRM data such as **Customers, Products, Orders, and Activities**.
5. **Flows** – Automates business processes such as record updates, notifications, and related actions.
6. **Dashboards** – Displays summarized CRM information through charts, metrics, and reports for monitoring and analysis

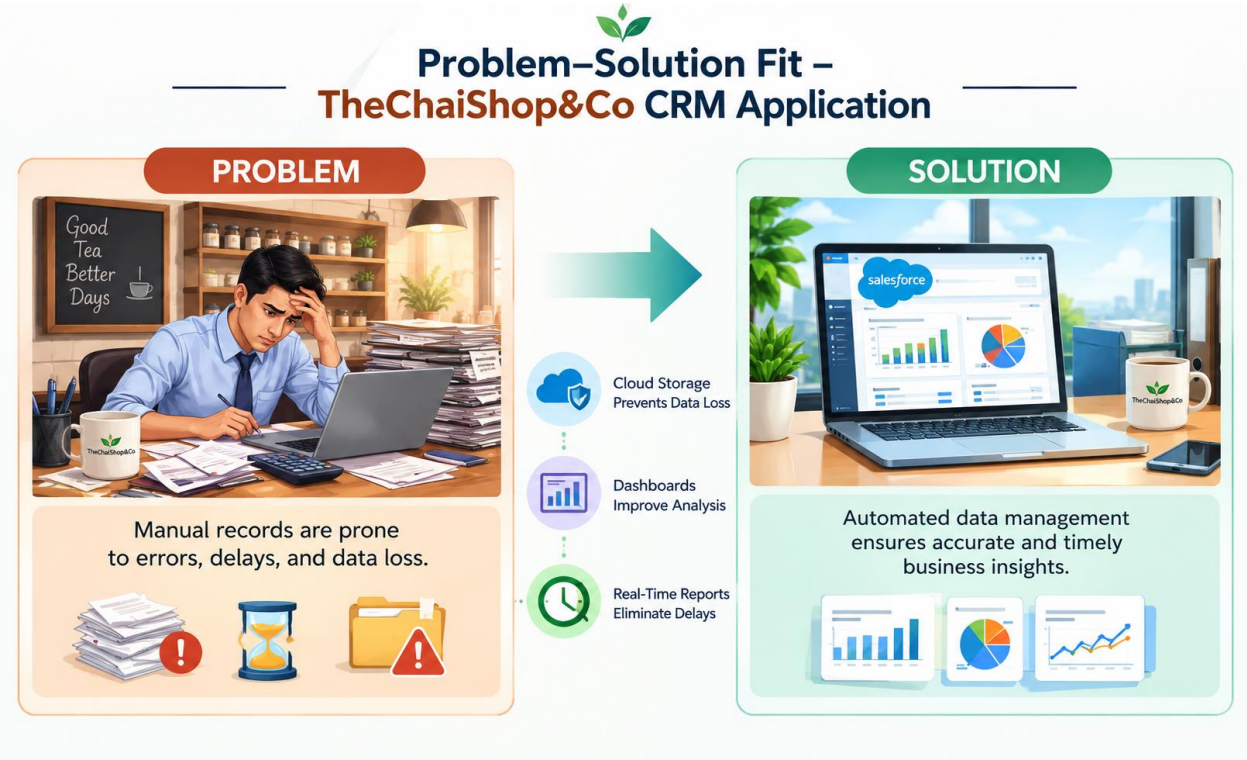

DATA FLOW DAIGRAM:

PROJECT DESIGN PHASE

Problem–Solution Fit

The CRM system replaces manual records with automated data management. Cloud storage prevents data loss, dashboards improve analysis, and real-time reports eliminate delays. This ensures accurate and timely business insights generation.

Proposed Solution

Functional Requirements

1. User Login & Authentication

The User Login & Authentication feature allows authorized users to securely access **The Chai Shop & Co CRM system** using valid Salesforce credentials. It helps protect customer and business information from unauthorized access.

2. Customer Record Management

The Customer Record Management feature enables users to create, view, update, and manage customer records. Important details such as customer name, contact number, address, and other relevant information can be maintained efficiently.

3. Employer & Enterprise Management

The Employer & Enterprise Management feature helps users maintain employer and enterprise account information. It supports the organization of business-related records and makes it easier to manage enterprise customers and their details.

4. Order Management

The Order Management feature allows users to create and track customer orders. It stores information such as customer details, product details, order quantity, order status, and other order-related information.

5. Automated Billing System

The Automated Billing System calculates the total bill amount automatically based on the selected product, quantity, and pricing information. Formula fields in Salesforce reduce manual calculations and improve billing accuracy.

6. Validation Rules

Validation Rules ensure that users enter accurate and valid information into the CRM system. Fields such as phone number, PAN, and Aadhaar can be validated according to predefined conditions before a record is saved.

7. Record Types & Page Layouts

Record Types and Page Layouts provide different interfaces and processes for different categories of customers and enterprises. They help display only the relevant fields and information based on the type of record being created or managed.

8. Global Picklists

Global Picklists maintain standardized values across the CRM system. They can be used for fields such as product type, category, order status, and other common values, ensuring consistent data entry.

9. Email Notification System

The Email Notification System automatically sends emails to customers based on specific business events. Notifications can be used for birthday wishes, promotional offers, order confirmations, and other important customer communications.

10. Workflow & Flow Automation

Workflow and Flow Automation reduce manual work by automatically performing predefined actions. Salesforce Flows can update records, send email notifications, create related records, and trigger alerts when specific conditions are met.

11. Report Generation

The Report Generation feature provides detailed reports about customers, orders, sales, and enterprise performance. These reports help users analyze business information and monitor important CRM activities.

12. Dashboard Visualization

Dashboard Visualization presents important business information using charts, graphs, and summary components. It provides a clear view of sales, customer activity, orders, and other key performance information.

13. Data Backup & Recovery

The Data Backup & Recovery feature helps protect important CRM information stored in Salesforce. It supports secure data management and helps organizations recover business information when required.

14. User Role Management

User Role Management controls the level of access provided to different CRM users. Salesforce Profiles, Roles, and Permission Sets can be used to ensure that users can access only the records and features required for their responsibilities.

Solution Architecture

Architecture Layers

1. Presentation Layer – Lightning UI
2. Application Layer – Flows and Logic

3. Data Layer – Custom Objects
4. Analytics Layer – Reports and Dashboards

This layered architecture ensures modularity, scalability, and maintainability.

PROJECT PLANNING & SCHEDULING

5.1 Project Planning

- The project followed an Agile-based development approach with defined milestones and sprints.
- A Salesforce Developer account was created to set up the development environment.
- Custom objects were designed to store customer, employer, and enterprise data.
- Custom tabs and a Lightning Application were developed for easy system navigation.
- Fields, relationships, and global picklists were configured to ensure data consistency.
- Page layouts and record types were created based on user roles and customer categories.
- Validation rules were implemented to prevent incorrect data entry.
- Email templates and automated flows were developed for customer notifications.
- Reports and dashboards were created for performance monitoring and analysis.
- Regular sprint reviews and testing were conducted to track progress and resolve issues.

- The project was completed within the planned timeline through systematic scheduling.

Project Development Phase:

Project Flow

1 : Creation of developer account

2 : Object Creation

3 : Tabs

4 : The Lightning App

5 : Global Picklist

6 : Fields and Relationships

7 : Creation of Page Layout

8 : Creation of Record Types

9 : Validation rules

10 : Email Templates

11 : Flows

12 : Reports and Dashboards

13 : Conclusion

What You'll Learn

1. Real-Time Salesforce Project

You will learn how to develop and implement a **real-time CRM project using Salesforce**. The project demonstrates how Salesforce can be used to manage customers, orders, business information, automation, and reporting in a practical business environment.

2. Standard and Custom Objects

You will learn the difference between **Standard Objects and Custom Objects** in Salesforce. Standard Objects are provided by Salesforce, while Custom Objects are created according to the specific requirements of the **TheChaiShop&Co CRM Application**.

3. Picklist Value Sets

You will learn how to create and use **Picklist Value Sets** to maintain standardized values across the CRM application. Picklists can be used for fields such as product category, order status, customer type, and other business-related information.

4. Types of Fields & Their Relationships

You will learn about different Salesforce field types, including **Text, Number, Date, Currency, Checkbox, Picklist, Formula, and Lookup fields**. You will also understand how fields and objects are related to each other using relationships such as **Lookup and Master-Detail relationships**.

5. Page Layouts

You will learn how to create and customize **Page Layouts** to control the fields, sections, buttons, and related lists displayed on Salesforce record pages. Page layouts help provide users with an organized interface based on their business requirements.

6. Record Types

You will learn how to create and configure **Record Types** for different categories of records. Record Types can provide different business processes, picklist values, and page layouts for different customer or enterprise requirements.

7. Validation Rules

You will learn how to create **Validation Rules** to ensure that users enter accurate and valid information. Validation rules can be used to check conditions such as phone numbers, PAN, Aadhaar, required fields, and other business-specific data requirements.

8. Email Templates

You will learn how to create and use **Email Templates** for automated customer communication. Templates can be used for order confirmations, birthday greetings, promotional offers, and other notifications generated by the CRM system.

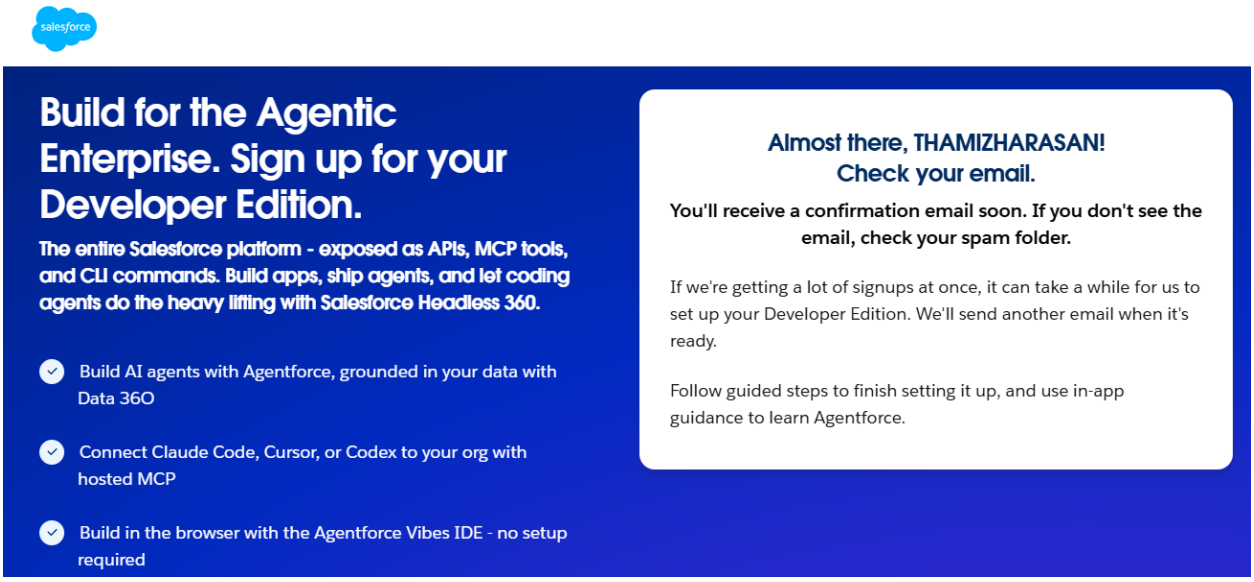

9. Flows

You will learn how to use **Salesforce Flow Builder** to automate business processes. Flows can automatically update records, send emails, create records, and perform other actions when specific conditions or events occur.

10. Reports and Dashboards

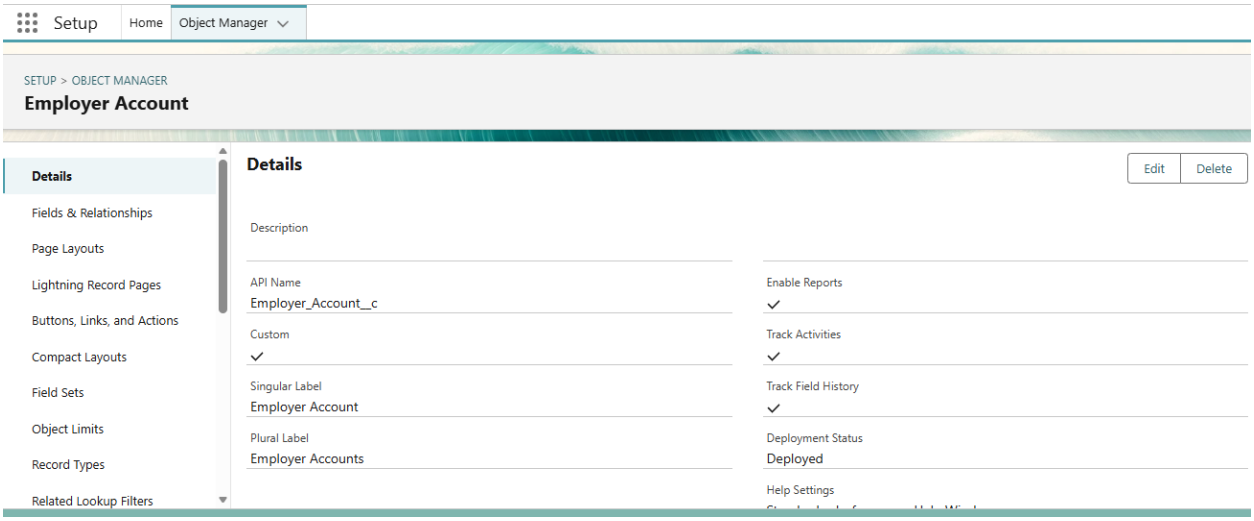

You will learn how to create **Reports and Dashboards** to analyze CRM data and monitor business performance. Reports provide detailed information about customers, orders, and sales, while dashboards present important data through charts and visual components for easier analysis.

Start the my group program step by step :

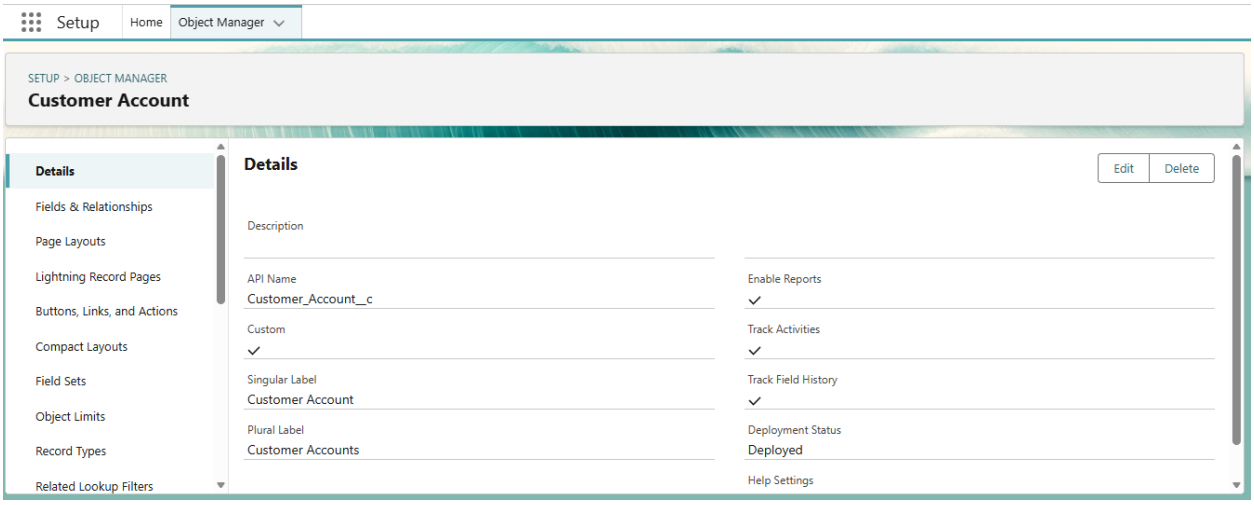

SALESFORCE LOGIN COMPLETED;

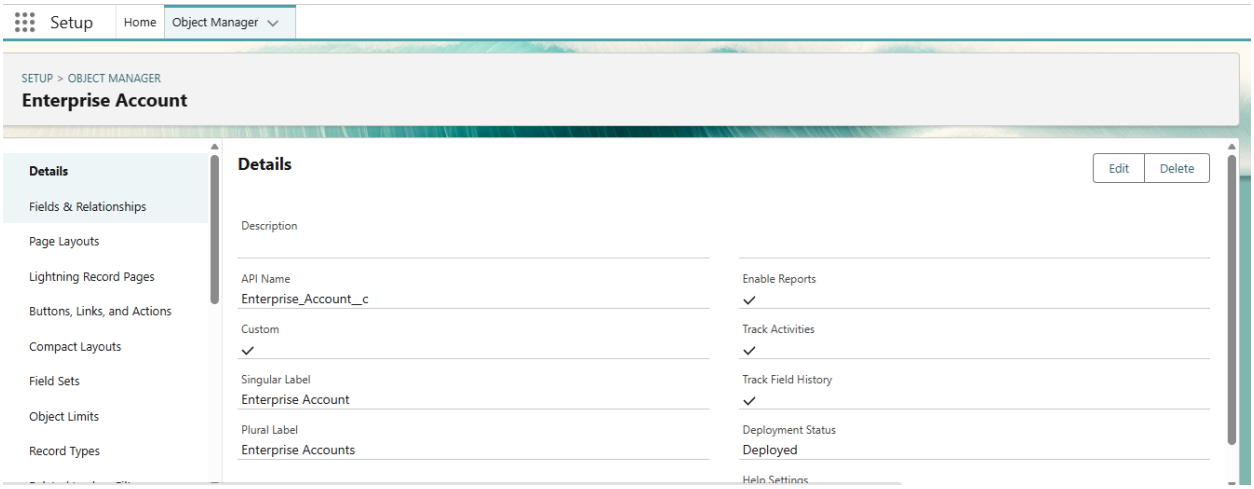

CREATED EMPLOYER ACCOUNT :

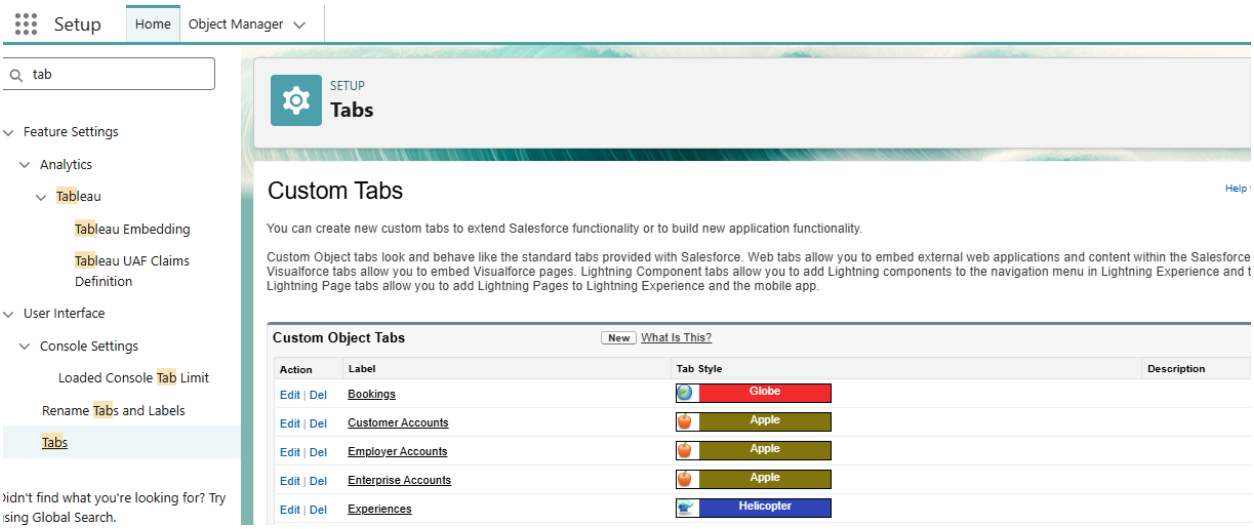

CREATE CUSTOMER ACCOUNT :

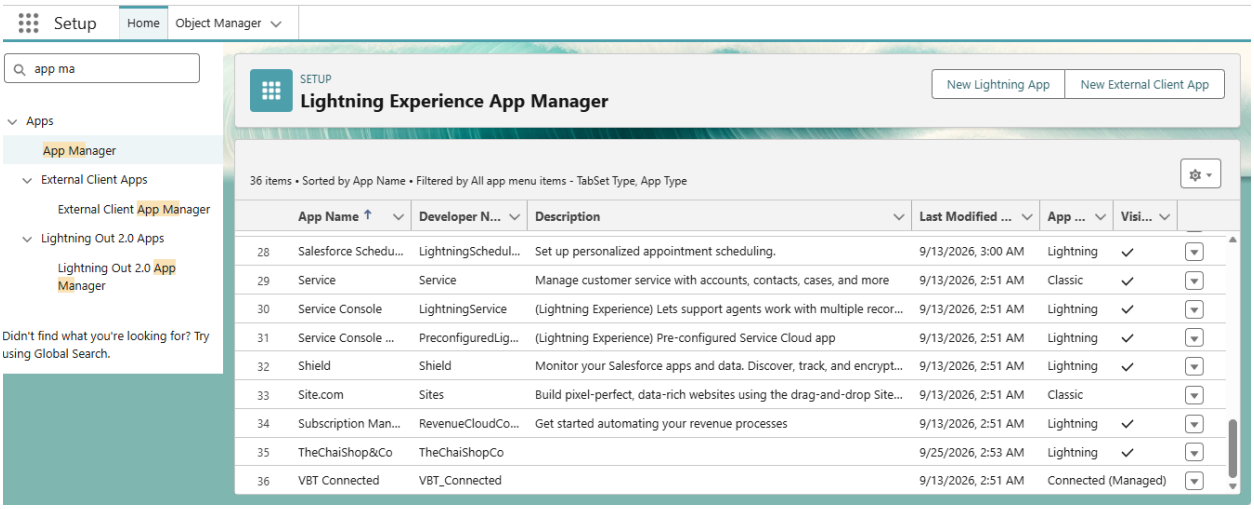

CREATE ENTERPRICE ACCOUNT :

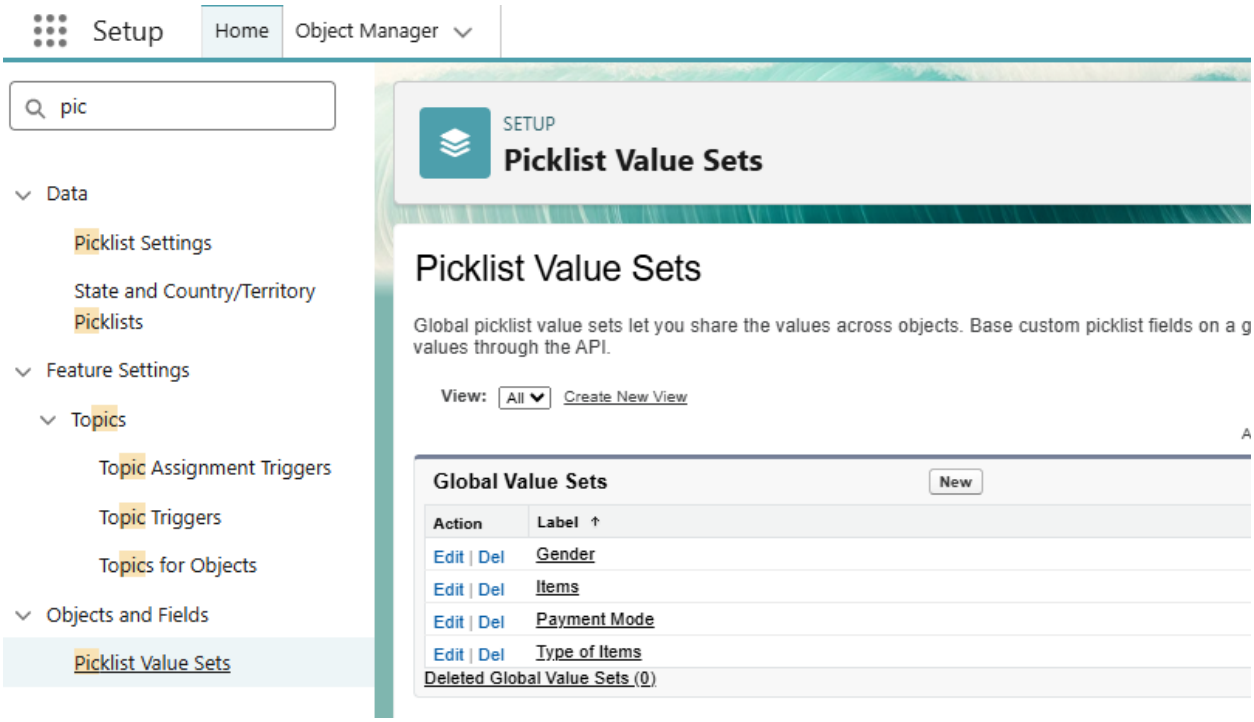

The first step was to create the required **Standard and Custom Objects** for storing business data. Custom objects were created for entities such as customers, products, orders, and other business requirements. Appropriate **fields and data types** were added to each object to capture the required information accurately.

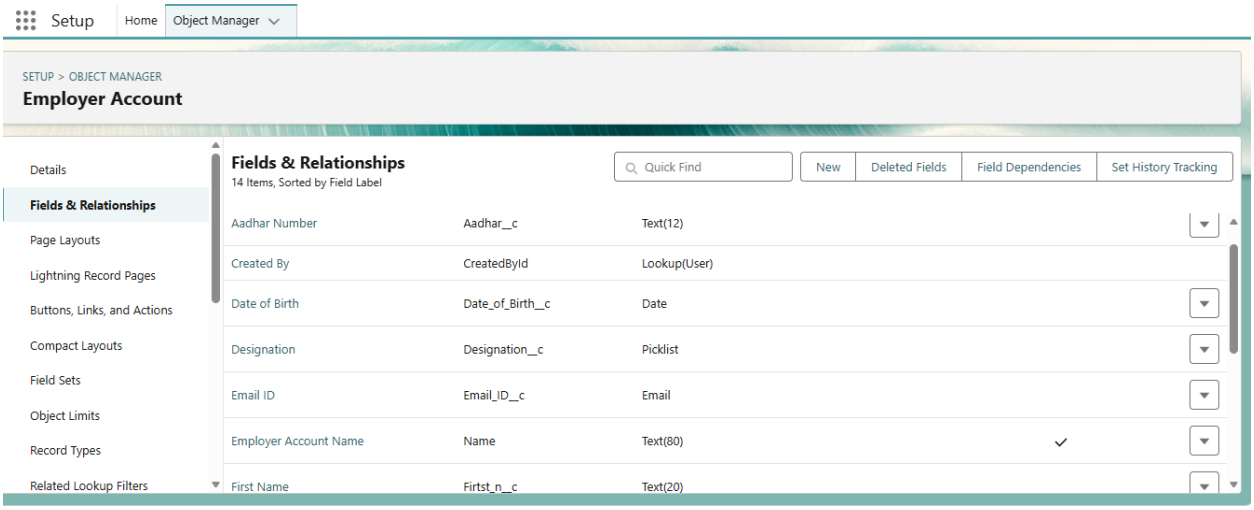

CREATE A PROJECT IN APP MANAAGER:

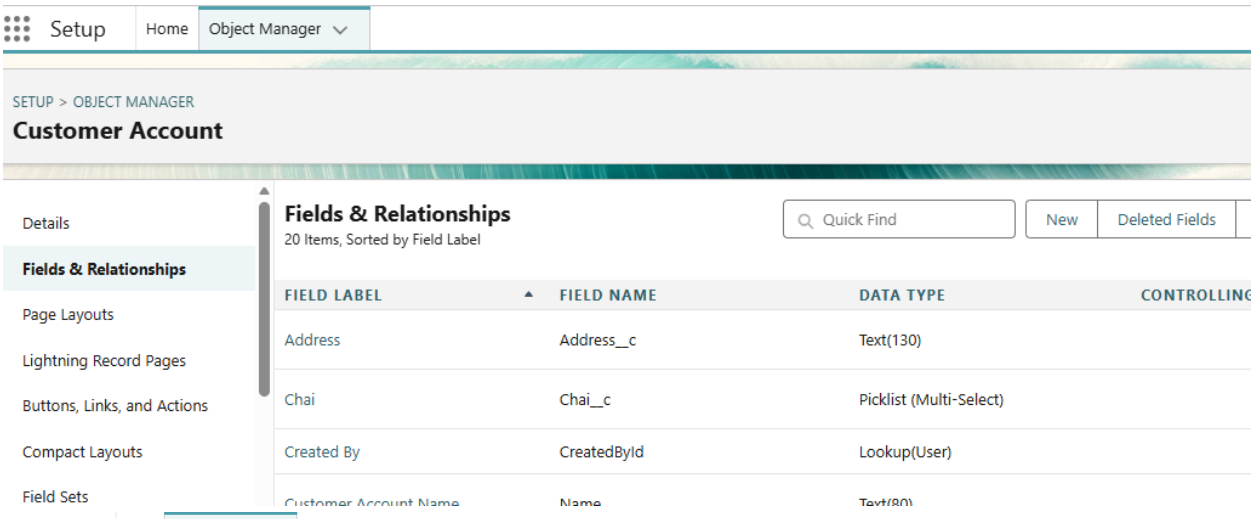

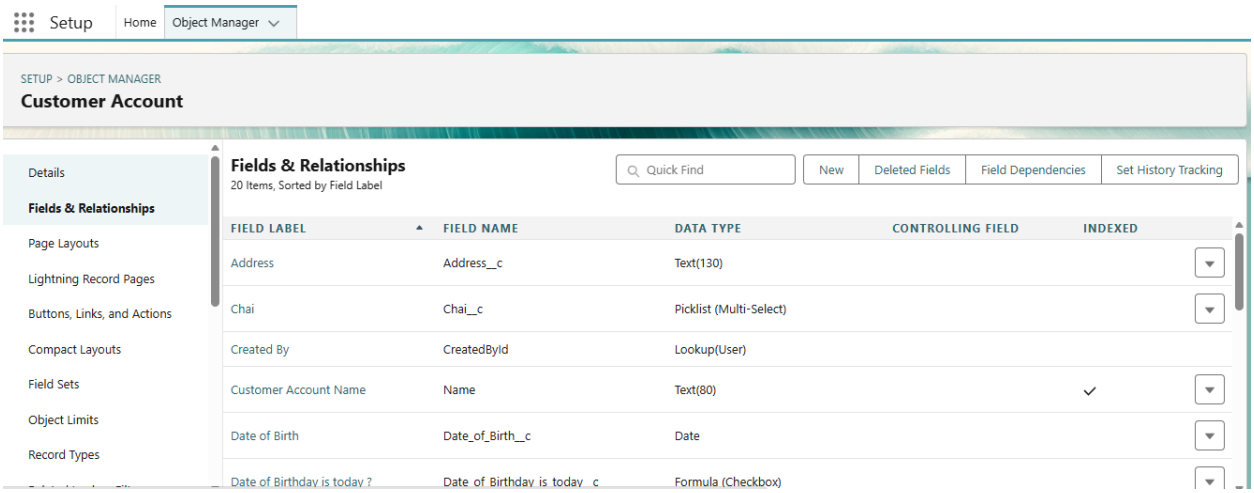

Picklist Value Sets were created to provide predefined values for fields such as status, category, order type, and other required options. **Relationships between objects** were configured using lookup and master-detail relationships where necessary. This helped connect related records and maintain proper data flow throughout the application.

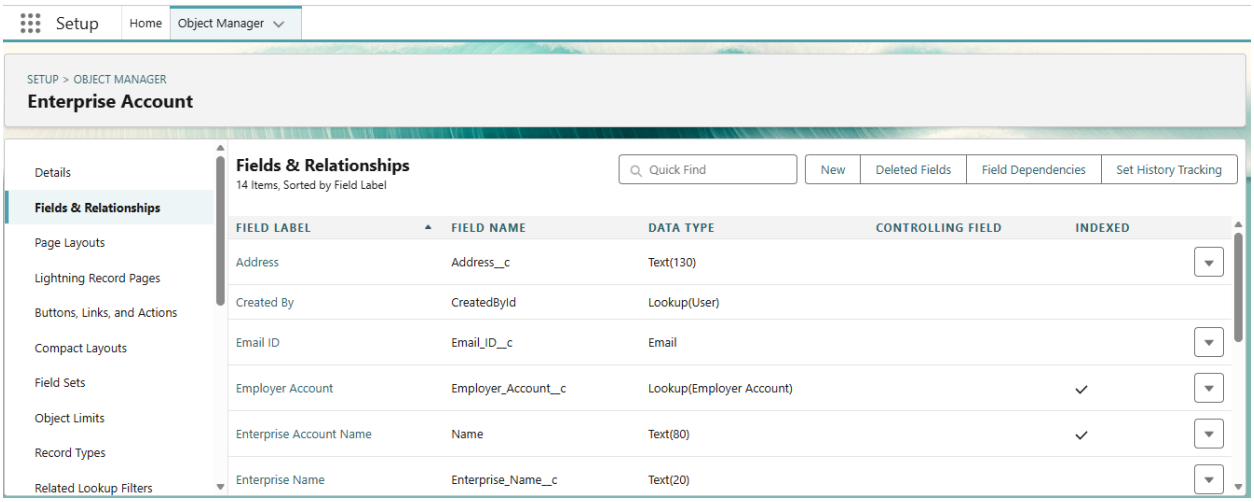

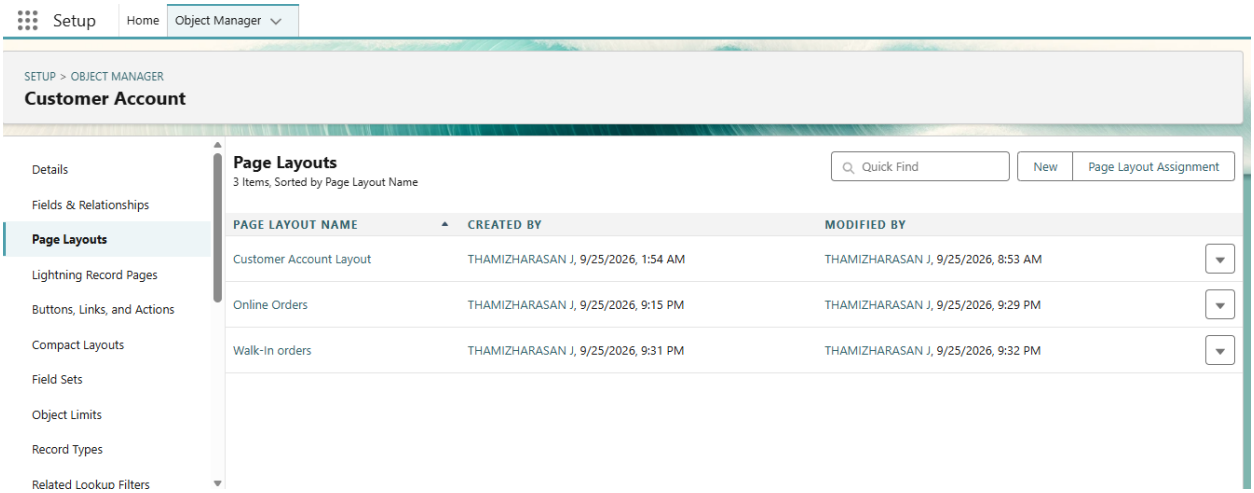

After creating the objects and fields, **Page Layouts** were configured to organize the fields and sections displayed to users. **Record Types** were created where different business processes or record variations were required. This made the application easier to use and allowed users to work with appropriate layouts and processes.

Email Templates were then created for sending standardized notifications to customers or users. Salesforce **Flows** were developed to automate repetitive business processes, update records automatically, send notifications, and reduce manual work.

Finally, **Reports and Dashboards** were created to analyze CRM data and provide meaningful business insights. Reports were used to display detailed information, while dashboards presented important metrics and summaries visually. After completing all configurations, the entire application was tested to verify that objects, relationships, validation rules, flows, reports, and dashboards worked correctly according to the project requirements.

Overall, the project provides **TheChaiShop&Co** with a centralized Salesforce CRM application that improves data management, automates business processes, reduces manual effort, and supports better monitoring and reporting.

Conclusion

The **“A CRM Application for TheChaiShop&Co”** project was successfully developed using Salesforce to provide a centralized and efficient system for managing customer and business-related information. The application was designed to simplify daily operations and improve the overall management of CRM data. It includes **standard and custom objects, fields, relationships, picklist value sets, page layouts, record types, and validation rules** to ensure that data is stored accurately and consistently.

The project also uses **Email Templates and Salesforce Flows** to automate important business processes, reduce repetitive manual work, and improve communication. **Reports and Dashboards** provide a clear view of business performance and help users monitor important activities and information. Proper testing was performed to ensure that all the configured components work according to the business requirements.

Overall, this Salesforce CRM application helps **TheChaiShop&Co** improve data management, increase operational efficiency, maintain data accuracy, and automate business processes. The project provides a scalable and user-friendly CRM solution that can be further enhanced in the future by adding more automation, advanced reports, integrations, and additional business functionalities.

THANK YOU
